The global SiC High-Frequency Transformer for SST market size is predicted to grow from US\$ 24.47 million in 2025 to US\$ 127 million in 2032; it is expected to grow at a CAGR of 27.0% from 2026 to 2032.

SiC High-Frequency Transformer for SST is an advanced magnetic component designed for silicon carbide-based solid-state transformer systems, enabling ultra-high-frequency power conversion, efficient voltage regulation, and compact energy architecture integration for next-generation data center and grid power applications. By leveraging SiC-based high-frequency operating environments, it significantly reduces core losses, enhances thermal stability, and improves switching performance compared with conventional transformer solutions, supporting high-power-density and highly efficient energy conversion systems. Its advantages include extremely low energy loss, high thermal endurance, fast dynamic response, superior power density, and strong compatibility with SiC power electronic architectures. In 2025, production was 630 units and the average price was USD 39,700 per unit. The industry's capacity utilization rate in 2025 was about 60% and the average gross margin was around 40%. Upstream, key raw materials include magnetic cores and copper wires, with representative suppliers such as TDK, VAC, Hitachi Metals, Southwire, Prysmian, and Sanhuan Magnet Group providing essential materials. The midstream segment focuses on high-frequency electromagnetic structure design, SiC-adaptive winding architecture, insulation system optimization, thermal management engineering, and high-frequency performance validation, which determine conversion efficiency, stability, and system scalability. Downstream, SiC High-Frequency Transformer for SST is mainly applied in data centers, with representative customers including Google, Microsoft, Amazon Web Services, Meta, Alibaba Cloud, Tencent Cloud, and IBM.

SiC-based high-frequency transformers are the magnetic core of next-generation Solid-State Transformers (SST). Driven by the surging power demands of AI data centers and 800V ultra-fast EV charging, they leverage SiC MOSFETs to operate at high frequencies, achieving extreme power density and efficiency. While the broader adoption of SSTs is currently gated by semiconductor costs, the commercialization of these transformers is accelerating alongside the maturation of wide-bandgap devices. Their evolution is intrinsically tied to the global transition toward intelligent, high-voltage DC power architectures.
