The global Side Suspension Imaging System market size is predicted to grow from US$ 287 million in 2025 to US$ 468 million in 2031; it is expected to grow at a CAGR of 8.5% from 2025 to 2031.

The side suspension imaging system is a technology that uses air flow or other suspension technology to suspend an object in the air and conduct non-contact, close-up observation through specific inference equipment. Unlike traditional suspension technology, the side suspension imaging system mainly obtains more comprehensive information about the surface, morphology or internal structure of the object by imaging the suspended object from a third or specific angle. The system is usually used in the fields of surface defect detection of objects or objects, scientific research, etc. It can achieve high-resolution, non-contact dynamic or static effects, and is suitable for application scenarios that require performance and high stability.

United States market for Side Suspension Imaging System is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Side Suspension Imaging System is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
