A sieve tray is a type of tray that is widely used in various industrial processes, such as distillation and filtration. It is essentially a perforated plate with numerous small holes of a specific size and arrangement. In distillation columns, for example, the sieve tray allows the vapor produced from the mixture to rise through the holes and emerge into the liquid on the tray above. The upward - flowing vapor creates a froth or bubble - like effect in the liquid, promoting efficient mass transfer and heat exchange between the vapor and liquid phases. In filtration applications, especially in soil analysis, a sieve tray acts as a filter to separate particles of different sizes. By placing a sample on the sieve tray and shaking it, larger particles are retained on the tray while smaller ones pass through the holes, enabling the analysis of particle size distribution. Overall, the design and operation of sieve trays make them suitable for processes requiring high capacity and efficiency, especially in systems with low liquid - to - vapor ratios.
