Signal processing platforms are computer hardware and software systems that are designed to process and analyze signals in real-time. These platforms typically consist of one or more processing units, such as digital signal processors (DSPs) or field-programmable gate arrays (FPGAs), along with software tools and interfaces that

enable the development of custom signal processing algorithms and applications.

Signal processing platforms can be used for a variety of applications, such as audio and video processing, wireless communications, biomedical signal analysis, and radar and sonar signal processing. They are often used in situations where real-time signal processing is required, such as in telecommunications systems, military applications, and industrial control systems.

One of the key advantages of signal processing platforms is their ability to handle large volumes of data and process it quickly and efficiently. This makes them well-suited for applications that require real-time signal processing, such as audio and video streaming, and data analysis.
