Signifor is an orphan drug approved in the United States and Europe for the treatment of Cushing's disease in patients who fail or are ineligible for surgical therapy.

Pasireotide is a somatostatin analog used to treat Cushing's disease and acromegaly. Its effectiveness in controlling hormone overproduction has driven market growth. The rising prevalence of these conditions, coupled with the drug's extended receptor binding profile, contributes to its popularity. However, limited clinical data and the need for individualized treatment plans may pose challenges. The market competition is relatively small compared to other treatment options. Despite challenges, the Pasireotide market offers potential for expansion as healthcare providers seek effective therapies for patients with Cushing's disease and acromegaly.
