Silane crosslinking agent refers to a silane containing two or more silicon functional groups, which can act as a bridge between linear molecules, so that multiple linear molecules or slightly branched macromolecules and polymers can be bonded and crossed with each other. It forms a three-dimensional network structure to promote or mediate the formation of covalent bonds or ionic bonds between polymer molecular chains. The cross-linking agent is the core part of the one-component room temperature vulcanized silicone rubber, which is the basis for determining the cross-linking mechanism and classification and naming of the product.
