The global Silica Excipient for Pharmaceutical market size is predicted to grow from US\$ 348 million in 2025 to US\$ 541 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Silicon dioxide is a white powder with good fluidity, high purity, and no pollution. It has the characteristics of small particle size, large specific surface area, and many pores. At the same time, the distribution of silicon hydroxyl groups on the surface gives it good adsorption performance. In the pharmaceutical field, micro silica gel is a very useful pharmaceutical excipient and an excellent flow promoter in the tablet production process. It can greatly improve particle flowability, increase bulk density, increase tablet hardness, shorten disintegration time, and thus improve drug dissolution rate. However, the potential of silica is not limited to this. It has also been involved in higher-level applications, such as crystal stability promoters, targeted formulations, sustained-release formulations, etc. Therefore, it is also known as a "universal excipient". The pharmaceutical silica excipient is high purity, porous amorphous gel silica, which provides moisture absorption, improves product stability and extends shelf life; It is chemically inert, colorless, odorless, and free of harmful ingredients, meeting the latest testing requirements. At present, there are also pharmaceutical excipient silica modified products in the pharmaceutical field, including two categories: self structural modification and blending modification. If the medicinal excipient silica is prepared into mesoporous silica nanoparticles, it can have a tailored pore structure and ultra-high surface activity, and can be used as an effective therapeutic drug delivery carrier, with significant advantages in drug packaging and transportation.
