Silicon boat for vertical furnace is a high-purity silicon carrier designed for vertical diffusion furnace or oxidation furnace process in semiconductor manufacturing, used to carry silicon wafers during high-temperature processing. Silicon boat is usually made of single crystal silicon or high-purity polycrystalline silicon, with good thermal stability, chemical inertness and low metal impurity content, which can effectively avoid contamination of chips in high temperature (usually 800°C–1200°C) environment. Its structure is mostly trough-type or cylindrical, which can arrange and fix multiple silicon wafers vertically to ensure uniform gas distribution and high process repeatability. It is widely used in key heat treatment processes such as oxidation, diffusion, annealing, etc. in IC manufacturing, solar cells, MEMS and other fields. Compared with traditional quartz boats, silicon boats have certain advantages in particle control, thermal expansion matching and product life, and are suitable for high cleanliness requirements in advanced processes.
