Silicon—carbon anodes have been explored extensively due to their high capacity, good operation potential, environmental friendliness and high abundance. Silicon—carbon anodes have demonstrated great potential as an anode Material for lithium-ion batteries because they have perfectly improved the problems that existed in silicon anodes, such as the particle pulverization, shedding and failures of electrochemical performance during lithiation and delithiation. However, there are still some problems, such as low first discharge efficiency, poor conductivity and poor cycling performance, which need to be improved.

Silicon negative electrode materials play an important role in the short term, but in the long run, silicon carbon negative electrodes will gradually dominate. The share of silicon carbon negative electrodes will be 17.01% in 2022, and it is expected that the share of silicon carbon negative electrodes will reach 34.62% in 2029. The global market for Silicon Carbon Negative Electrode Material estimated at US\$ 73.71 million in the year 2022, is projected to reach a revised size of US\$ 1472.75 million by 2029, growing at a CAGR of 57.51% during the forecast period 2023-2029.
