## Abstracts

The global Silicon Fume market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Silicon fume refers to the fine particles or granular substances formed by silicon oxides under high temperature conditions. When silicon (usually silicon metal or silicon compounds) is burned or heated in an oxygen-containing environment, tiny particles of silicon oxide (silica) are produced, which are often called silicon fume. Silicon fume may be a by-product of the processing, smelting, sintering or other processes of silicon materials. Due to its tiny particle size and light weight, silica fume can remain suspended in the air for long periods of time and can cause health and environmental hazards. Therefore, in related industrial production processes, measures are usually required to control the emission of silicon fume.

United States market for Silicon Fume is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
