The global Silicon Germanium Alloy Materials market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

SiGe alloy is a kind of semiconductor alloy. It is a p-type semiconductor doped with Group III elements and a n-type semiconductor doped with Group V elements. Thermocouples are composed of n and p-type alloys. One end is high temperature and the other end is low temperature. A current is generated in the thermal couple circuit. The utility model relates to a semiconductor thermoelectric power generation material used for high temperature. The resistivity is $10^{-2} \sim 10^{-3} \Omega \cdot m$. The single crystals were prepared by zone smoothing method. Polycrystals were prepared by hot pressing. SiGe alloy can be said to be a new type of semiconductor material, which is of great significance for the development of microelectronic technology.
