The global Silicon Oxide Wafers market size is predicted to grow from US\$ 197 million in 2025 to US\$ 273 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

Silicon Oxide Wafers, also referred to as silicon dioxide wafers or SiO₂-coated silicon wafers, are functional semiconductor substrates with a silicon dioxide layer formed on the surface of a silicon wafer. Their primary value lies in the oxide layer, which provides electrical insulation, dielectric isolation, surface passivation, process protection, diffusion/etch masking, and structural support during device fabrication. Compared with bare silicon wafers, silicon oxide wafers are widely used as base substrates for semiconductor process development, MEMS devices, sensors, power devices, silicon photonics, optical communication components, microfluidics, biomedical chips, and R&D test platforms. The SiO₂ layer is valued for its uniformity, compactness, dielectric strength, and stable silicon-oxide interface, making it suitable for applications requiring reliable insulation, low leakage, stable surface conditions, or subsequent thin-film deposition and patterning.

In terms of price, the price of silicon oxide wafers mainly depends on their size and the thickness of the oxidation process.

The average price of commonly used silicon oxide wafers is between 50-70 USD per piece.

Silicon oxide wafers are not a large-scale wafer market; rather, they represent a niche market situated between 'silicon substrate + surface oxide film processing + small-batch/customized functional wafers.' Current demand primarily comes from R&D, MEMS, silicon photonics/optical communication, power devices, sensors, process verification, test wafers, and the manufacturing of some specialized devices. Overall,

the demand is not as large as that for 8/12-inch silicon wafers.
