The global Silicon Photonics Interconnect Chip market size is predicted to grow from US\$ 2543 million in 2025 to US\$ 9017 million in 2032; it is expected to grow at a CAGR of 18.7% from 2026 to 2032.

Silicon Photonics Interconnect Chip integrates optical modulation, detection, coupling and sometimes driver or control functions on a silicon-based platform to transmit high-speed data through light. It is used in optical transceivers, co-packaged optics, optical I/O and data-center interconnect systems. In 2025, global Silicon Photonics Interconnect Chip production reached approximately 55,000 K units.

AI data centers are the largest incremental demand driver. As accelerator clusters scale, electrical interconnects face power and reach limitations, while silicon photonics offers a path to higher bandwidth density and lower energy per bit for 800G, 1.6T and future optical links.

The market is shifting from traditional pluggable optical modules toward deeper integration with switching and compute systems. Co-packaged optics and optical I/O are still in staged deployment, but they are shaping product roadmaps because they can reduce front-panel congestion, trace loss and thermal pressure.

Commercial success depends on packaging yield, laser integration, thermal stability and supply-chain coordination between foundries, optical-component vendors and system companies. Companies with mature photonic platforms and high-volume packaging partners are better positioned as demand moves from telecom-grade optical devices to hyperscale data-center volumes.
