The global Silicon Wafer Cleaning Fluid market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Silicon wafer cleaning fluid is used to remove contaminants on the surface of silicon wafers, such as particles, metal ions and organic matter. During the semiconductor manufacturing process, silicon wafers undergo multiple steps such as cutting, grinding, and polishing, which leave dirt on the surface of the wafer. In order to ensure that the cleanliness and surface condition of the silicon wafer meet the requirements, it is very important to use cleaning fluid to remove these contaminants. Types of cleaning solutions include alkaline solutions, acidic solutions and organic solvents, which remove impurities on the silicon wafer through chemical reactions or dissolution. In addition, the cleaning process has an important impact on improving device performance and reliability, and improper handling may lead to scrapped silicon wafers. There are many cleaning methods, including spray cleaning and immersion cleaning, as well as the use of ultrasonic, ozone water, electrolyzed ionized water and other technologies to improve the cleaning effect. These methods are designed to achieve process clean surfaces, reduce environmental pollution, and meet increasingly stringent wafer quality requirements.
