## Abstracts

The global Silicone-based Thermal Interface Materials market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Silicone-based thermal interface materials are compound materials which contain a high ratio of thermally conductive fillers. They exhibit outstanding thermal conductivity because they fit snugly in the gap between the heat-generating unit and the heatsink.

The performance of electronic devices is constantly improving, but they consume more power and generate greater heat. If heat can not escape efficiently, the performance of the device suffers. That's why thermal interface materials are becoming such an important technology in the electronics industry.
