## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Silicon rings for etching machine are mainly used on 8-12 inches (i.e., 200mm-300mm) plasma etcher. In the manufacturing process of integrated circuits, high-purity silicon components and wafers are made of silicon, which makes the electrical properties of etching more uniform, so silicon rings are widely used in semiconductor etchers. The periodic consumption of silicon ring products has become an important consumable component in the wafer processing process, which directly affects the electrical properties of the wafer. The main technical requirements of the silicon ring include electrical parameters (i.e., conductivity type, resistivity, and radial resistivity change), geometric size, crystallographic orientation, and degree of deviation from crystallographic orientation, oxygen content, carbon content, crystal defects, surface quality, surface roughness.

The global Silicone Rings for Etching Machine market size is projected to grow from US\$ 410 million in 2024 to US\$ 836 million in 2030; it is expected to grow at a CAGR of 12.6% from 2024 to 2030.
