The global Silver Chloride Conductive Paste market size is predicted to grow from US\$ 1348 million in 2025 to US\$ 2055 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

Silver chloride conductive paste is a low-temperature curing paste that disperses micron-sized silver chloride particles in an organic carrier, providing both conductive and reference electrode functions. It is widely used in disposable electrocardiogram (ECG) electrodes, EEG patches, medical sensors, and printed bioelectronic circuits. Global sales in 2024 were expected to reach approximately 31,000 tons, with an average unit price of US\$42 per kilogram. The leading single-line annual production capacity is approximately 900 tons. Its upstream customers include manufacturers of refined silver, chlor-alkali chemicals, and specialty solvents, while its downstream customers include manufacturers of medical consumables, wearable electronics, and disposable diagnostic devices.

Driven by the explosive demand for remote monitoring and home chronic disease management, monthly shipments of ECG patches have jumped from millions to tens of millions. Overseas brands have combined electrodes, wires, and disposable foam into a complete device with a BOM of less than US\$0.8, forcing slurry manufacturers to reduce the silver content from 30% to 15% and introduce carbon nanotubes to maintain impedance stability. Domestic manufacturers have reduced costs by another 20% through the silver-coated copper and silver chloride co-precipitation process, while using halogen-free, highly flexible resin systems to enter the European and American high-end monitoring patch supply chain. In the next two years, whoever can be the first to launch an environmentally friendly slurry with a low impedance of 10 milliohms, fast curing in 60 seconds, and resistance to gamma sterilization will be able to obtain a

differentiated premium in the price red ocean and lock in the next round of volume dividends for wearable medical consumables.
