The global Silver Impregnated Activated Carbon market size is predicted to grow from US\$ 26.01 million in 2025 to US\$ 36.90 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Silver Impregnated Activated Carbon is an advanced composite material created by loading silver ions or nanoparticles onto the surface of conventional activated carbon through physical or chemical processes. This material combines the high surface area and excellent adsorption capacity of activated carbon with the strong antibacterial, antiviral, and catalytic properties of silver. As a result, it finds broad applications in water purification, air filtration, medical protection, and food storage. Silver impregnated activated carbon not only effectively removes organic pollutants, odors, and harmful gases, but also suppresses bacterial and fungal growth, addressing the limitation of traditional activated carbon in secondary contamination control. In drinking water systems, it is often used to inhibit microbial proliferation and ensure long-term safety; in air purifiers and protective masks, it enhances antimicrobial efficiency and improves overall protective performance.

Food and beverage companies require not only the removal of residual chlorine, odors, and organic matter from process water, but also the reduction of the risk of microbial growth during filtration system downtime. Similarly, beverage bottling, food processing, pharmaceutical water pretreatment, and some medical and dialysis water treatment processes all place high demands on the cleanliness and stability of filter media. Eurocarb currently applies its activated carbon for water treatment in residential and commercial water purification, kidney dialysis water, and bottled and soft drink process water applications; ResinTech's silver-loaded coconut shell granular activated carbon is specifically designed for inhibiting bacterial growth in drinking water, while also

performing dechlorination, odor removal, and organic matter removal.

The industry's technological focus is shifting from simply increasing silver loading to low silver content, uniform dispersion, low silver precipitation, and long-lasting antibacterial effects. Silver is a high-value metal; excessively high loading not only increases product costs but may also occupy some of the activated carbon's pores and alter adsorption performance. If the silver is not firmly fixed, issues of silver ion migration and drinking water compliance need to be addressed. Future competition in the high-end market will focus on silver particle size, silver distribution, loading uniformity, binding strength, and long-term release curves, rather than simply comparing nominal silver content.

Coconut shell activated carbon is characterized by high hardness, well-developed microporous structure, high specific surface area, and low dust content, making it particularly suitable for small fixed beds and filter cartridges. For frequent water rinsing, filter cartridge transportation, and long-term use, high mechanical strength can reduce carbon powder shedding and pressure drop changes; therefore, the quality of the base carbon is gradually becoming an important competitive factor affecting the performance of the final product.
