Silver Iodide flares are devices used in cloud seeding operations to disperse seeding agents into the atmosphere. Cloud seeding is a weather modification technique aimed at enhancing precipitation by introducing various substances into clouds. The most common seeding agents are silver iodide, potassium iodide, or sodium chloride, which act as ice nuclei or hygroscopic particles to promote the formation of ice crystals or droplets within clouds.

Cloud seeding flares are designed to be released from aircraft or ground-based generators. They contain the seeding agents and are usually made up of a mixture of the seeding material and a combustible compound. When ignited, the flares release the seeding agent into the atmosphere, where it can interact with supercooled water

droplets in the cloud. The seeding agent provides nucleation sites for the water droplets to freeze or coalesce, increasing the likelihood of precipitation in the form of rain or snow.
