Silver Powder for PERC Metallization Pastes refers to PV-grade, high-purity silver particles engineered as the conductive phase in fired-through silver pastes used on PERC cells. Its particle size distribution, morphology (spherical/flake or hybrids), surface chemistry, and impurity control strongly influence paste printability, sintering behavior, line conductivity, and the contact formation quality in high-temperature firing processes.

Upstream, PV silver powders are typically produced from refined silver (often via soluble silver salts such as AgNO₃) using controlled wet-chemical reduction and post-treatments; surfactants/processing conditions are used to control agglomeration, morphology, and size distribution. Downstream, the powder is supplied to paste formulators who blend it with glass frit and organic vehicles to make PERC metallization pastes, which are then screen-printed and co-fired in industrial PERC manufacturing lines.

In 2025, global sales of Silver Powder for PERC Metallization Pastes reached approximately 2,208 tons, with an average global market price of around US\$ 913/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 2% to 10%.
