The global Silver Recovery from Spent Solar Panels market size is predicted to grow from US\$ 70.43 million in 2025 to US\$ 114 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Silver recovery from spent solar panels refers to the process of extracting and purifying metallic silver from discarded or scrapped solar photovoltaic modules using physical, chemical, or metallurgical techniques. Demand primarily stems from the large-scale retirement of photovoltaic modules and the strategic scarcity of silver resources. The upstream supply chain encompasses waste module collectors, dismantling and pre-processing companies, and recycling equipment/chemical suppliers. Downstream, it connects silver smelters and refineries, precious metal traders, and ultimately supplies recycled silver to photovoltaic silver paste manufacturers and the electronics industry, forming a closed-loop circular supply chain of 'waste modules—silver recycling—recycled silver—new modules,' a crucial link in achieving sustainable development and resource security for the photovoltaic industry. In 2025, the amount of silver recovery from spent solar panels is estimated at 90 tons. The average price, closely related to the silver content, form, purity, and international silver price, is approximately US\$800 per kilogram, with a gross profit margin of about 35%.
