The global SimDis Analysis Software market size is predicted to grow from US$ 157 million in 2025 to US$ 240 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

Simulated distillation analysis software is specialized software for gas chromatographs. By analyzing the elution sequence of oil components in a non-polar chromatographic column, it quickly determines the boiling point distribution and distillation range of petroleum products (such as gasoline, diesel, and crude oil). It conforms to standards such as ASTM and converts chromatographic data into simulated distillation characteristic curves.

The industry is primarily driven by both the pressure of energy transition and technological hardware upgrades. Firstly, there's the precision yield management under integrated refining and chemical processes: with narrowing profit margins, the energy savings and yield improvements achieved by lowering the cut-off temperature by 1?C directly determine a refinery's competitiveness. This forces companies to purchase more precise simulated distillation software to replace inefficient physical distillation. Secondly, the implementation of global carbon footprint audit policies allows software to analyze residue oil content, helping companies optimize hydrotreating processes and thus reduce carbon intensity.
