The global SiMiP Chip market size is predicted to grow from US\$ 35.82 million in 2025 to US\$ 870 million in 2032; it is expected to grow at a CAGR of 41.8% from 2026 to 2032.

SiMiP Chip (Silicon Micro-LED in Package) is a silicon-based packaged micro-LED chip technology that integrates red, green, and blue primary color micro-pixels on a silicon substrate to achieve full-color output in micro-pitch displays. This technology simplifies the manufacturing process, eliminating the need for mass transfer and complex repair steps, improving first-pass yield, reducing manufacturing costs, and avoiding the use of toxic materials. The RGB three-primary-color pixels exhibit high consistency in emission wavelength, operating voltage, and light distribution, fundamentally solving the color shift problem of traditional micro-pitch solutions. SiMiP chips are widely used in microdisplays, wearable devices, AR/VR headsets, and micro-projection light sources, providing miniaturized display solutions with high brightness, high resolution, and low power consumption. In 2025, global SiMiP chip shipments were approximately 134,000 units, with an average price of approximately US\$273.29 per unit and a gross margin of approximately 17.93%. Once fully operational, companies can achieve a monthly production capacity of 150,000 units.

As a key innovation in silicon-based packaged micro-LED technology, SiMiP chips represent the development of micro-pitch display technology towards high yield, low cost, color consistency, and optimized system integration. Compared to the traditional MicroLED manufacturing route, which requires massive transfer and repair, SiMiP integrates RGB three-primary-color pixels on a single chip, greatly simplifying the process path, improving first-pass yield, and effectively reducing manufacturing difficulty and material waste. This is of great significance in alleviating the yield bottleneck and cost pressure that have long constrained the industry. With the rapid expansion of terminal markets such as AR/VR, wearable devices, and micro-projection displays,

SiMiP chips, with their advantages of packaging friendliness, high thermal management efficiency, good luminous consistency, and high device reliability, are gradually becoming one of the mainstream technologies in the micro-display sub-sector. Market growth drivers include the increasing demand for high-brightness micro-displays in consumer electronics, the stringent requirements for module stability in industrial and automotive displays, and the continuous pursuit of packaging integration across the industry chain. At the same time, the maturity of SiMiP technology has also promoted the development of related packaging ecosystems, such as driver IC matching, module design standardization, and micro-display solution integration, forming a more complete industry chain. Despite competition from alternative technologies such as COLED or quantum dot microdisplays, SiMiP remains highly attractive in the short term due to its advantages in yield and consistency, and is expected to maintain rapid growth in the global microdisplay market.
