The global SiMiP Silicon-based micro-LED Display Modules market size is predicted to grow from US\$ 64.14 million in 2025 to US\$ 732 million in 2032; it is expected to grow at a CAGR of 41.8% from 2026 to 2032.

SiMiP Silicon-based Micro-LED Display Modules are display systems based on silicon substrate-packaged micro-LED technology. They achieve micro-pitch full-color displays by integrating red, green, and blue primary color pixels on a single chip. The module combines multiple integrated chips, driver ICs, control boards, packaging structures, and optical bonding components into independently usable micro-display units. SiMiP display modules feature high brightness, high resolution, low power consumption, and miniaturization, and are widely used in AR/VR headsets, wearable devices, micro-projectors, and automotive HUDs. This module improves production yield by simplifying traditional mass transfer and repair processes and ensures RGB pixel emission consistency, thereby enhancing display quality and reliability. In 2025, global SiMiP silicon-based micro-LED Display Modules were in early mass production, with estimated global shipments of approximately 60,000 units, a unit price of approximately US\$1092.92, and a gross margin of approximately 25%.

SiMiP display technology is currently in the small-batch pilot production stage, primarily focused on high-end microdisplay applications and the AR/VR wearable device market. The core objectives of the pilot production phase include verifying the process stability of single-chip RGB integration, evaluating packaging consistency and thermal management performance, and optimizing module yield and system integration efficiency. As the manufacturing process matures, through-yield is expected to improve significantly, thereby reducing the cost per screen. During pilot production, the market is primarily driven by demand from early-stage high-end consumer electronics

manufacturers, while test feedback will guide subsequent mass production design and scale-up. Initially, prices will remain higher than traditional Micro-LED display modules, but with process optimization and mass production scaling, unit costs are expected to decrease, further driving the penetration of SiMiP displays in the micro-display and portable display markets.
