Single inline memory module (SIMM) sockets are computer memory expansion holders that connect memory modules to printed circuit boards (PCBs). These are different from dual inline memory modules (DIMM) sockets in that the contacts on a SIMM are redundant on both sides of the module. These SIMM sockets feature single-row pins that connect to the board vertically or at predetermined angles. These are easily inserted or extracted since these are not soldered onto the circuit board, so these can be a good space-saving option.

The global SIMM Socket market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
