SNMP (Simple Network Management Protocol) Trap Receiver is a software application or a hardware device that listens for SNMP trap messages sent from various network devices, such as routers, switches, servers, and printers.

SNMP traps are asynchronous notifications that alert the SNMP manager (the trap receiver) about specific events or conditions that occur on the managed devices, such as system errors, hardware failures, or network congestion.

The SNMP trap receiver collects these trap messages, processes them, and may take actions based on the information received. These actions could include logging the event, sending alerts or notifications to administrators, or triggering automated responses to resolve the issue.
