The artificial ear is a device that can simulate the human ear's reception, transmission and processing of sound. It usually consists of one or more mutually acoustically coupled coupling cavities, which have an acoustic impedance equivalent to the average acoustic impedance of the human ear, so that the acoustic impedance of the earphone or receiver is close to the average acoustic impedance of the human ear. In addition to basic acoustic measurements, the artificial ear can also perform signal processing and analysis to meet the needs of different fields.
