The basic principle is to convert cytosine deaminase (APOBEC) or adenosine deaminase is formed by fusion with the existing Cas9n (D10A), relying on the CRISPR principle to modify a single base at positions 4-7 away from the PAM end of the target. Currently, there are two types of base editors widely used: adenine base editor (ABE) and cytosine base editor (CBE). They have shown great achievements in basic research, gene therapy, animal and plant breeding improvement and other fields. application value.
