The global Single Burner Camping Stove market size is predicted to grow from US\$ 319 million in 2025 to US\$ 468 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

In 2025, global Single Burner Camping Stove production reached approximately 6,650 K units, with an average global market price of around 49 US\$/unit.

A Single Burner Camping Stove is a portable, compact outdoor cooking appliance designed with a single combustion burner, specifically developed for outdoor scenarios such as camping, hiking, picnics, and outdoor adventures. It is characterized by lightweight, small size, and easy portability, usually adopting foldable or detachable structures to save storage and carrying space, and can be powered by different fuels including butane, propane, isobutane mixtures, or kerosene according to usage needs. Compliant with the national recommended standard GB/T 38522-2020?Outdoor Gas Burning Appliances?, it features quick ignition, adjustable firepower, and simple operation, while prioritizing safety with protective devices to prevent gas leakage or flameout. Different from multi-burner camping stoves, it focuses on single-person or small-group use, balancing portability and basic cooking needs, and is widely favored by outdoor enthusiasts for its lightweight design?many models use lightweight materials such as titanium alloy to reduce weight to below 90G, making it easy to carry in backpacks. It can efficiently heat food and boil water, serving as an essential piece of outdoor gear to meet the basic cooking needs of outdoor activities.

The average single-line production capacity of Single Burner Camping Stove is 290 K units, the average gross profit margin was 40.5%.

The industry chain of the Single Burner Camping Stove covers three core links: upstream, midstream, and downstream. The upstream mainly includes suppliers of lightweight raw materials (titanium alloy, aluminum alloy, etc.), engineering plastics, fuel-related materials, and auxiliary parts, whose quality and price directly affect the product's performance and cost. The midstream involves R&D, precision processing, assembly, and quality inspection of the stoves, with many enterprises providing OEM/ODM services and focusing on optimizing lightweight and safety performance. The downstream includes online and offline sales channels, as well as end users such as outdoor enthusiasts, individual consumers, and commercial clients like camping resorts.

The cost structure of the Single Burner Camping Stove has a clear weight distribution: raw materials account for 40%-50% (the largest proportion), mainly lightweight metals and plastics, with fuel material prices indirectly affecting overall costs. Production and processing costs account for 25%-35%, including processing, assembly, and surface treatment, with titanium alloy products having higher processing costs. Packaging and logistics costs account for 10%-15%, and R&D and marketing costs account for 5%-10%, with R&D investment increasing as consumer demands for performance and safety rise.

The demand for Single Burner Camping Stoves is driven by the popularity of outdoor activities, rising demand for portable outdoor gear, emphasis on safety and comfort, and supportive outdoor policies. Consumers are increasingly willing to pay for high-quality, lightweight products, with growing demand for multi-functional and personalized models. Business opportunities lie in optimizing materials and processes to reduce costs and improve performance, developing windproof and multi-fuel models, expanding sales channels, and developing energy-saving, environmentally friendly products to seize the booming outdoor market.
