The report requires updating with new data and is sent in 48 hours after order is placed.

Single cell multiomics technologies typically measure multiple types of molecules from the same individual cell, allowing for more in-depth biological insight than can be gained by analyzing each molecular layer from separate cells. Single-cell multimodal omics (scMulti-omics) technologies allow for the measurement of multiple modalities from the same cell, including DNA methylation, chromatin accessibility, RNA expression, protein abundance, gene perturbation, and spatial information, unlike live-cell fluorescence imaging, which involves the destruction of cells for analysis.
