The global Single-cell Omics market size is predicted to grow from US\$ 2189 million in 2025 to US\$ 6416 million in 2032; it is expected to grow at a CAGR of 16.9% from 2026 to 2032.

Omics is a term summarizing different comprehensive molecular analyses, such as genomics, transcriptomics, proteomics, lipidomics or metabolomics. Transcriptomics for example does not only analyze the expression of a single gene, but investigates the expression pattern of many or even all genes. Omics analyses have been performed across whole tissues or organs. Today, with emerging technologies in single cell isolation and more sensitive molecular technologies, omics analyses can also be conducted at single cells resolution. These so called single cell omics analyses are providing unique insights into the heterogeneity of cells across tissues.

New advances in single-cell technologies are facilitating the opportunity to discern biological insights within individual cells. Moreover, the newer single-cell platforms have fueled cellular separation and analysis capabilities that have created higher interest among researchers, particularly in the arena of individual cellular genomics. Thus, the evolving demand for novel single-cell analysis platforms is pushing manufacturers to launch innovative products in the market.
