Abstracts

The global Single Cell Sequencing Platform market size is predicted to grow from US\$ 3081 million in 2025 to US\$ 6236 million in 2032; it is expected to grow at a CAGR of 10.9% from 2026 to 2032.

A Single Cell Sequencing Platform refers to an integrated workflow for single-cell capture or partitioning, barcoding, library preparation, sequencing compatibility and data analysis, rather than only a sequencing instrument. Major technology routes include droplet microfluidics, microwell systems, combinatorial indexing, instrument-free emulsion capture and single-cell multiomics platforms, supporting scRNA-seq, scDNA-seq, immune profiling, multiomics and perturbation-screening research. The industry chain includes upstream microfluidic chips, beads, enzymes, primers, antibodies, reagents, optical/fluidic components and software algorithms; midstream single-cell platforms, kits and analysis systems; and downstream academic research, translational medicine, pharmaceutical R&D, immunology, oncology, developmental biology and cell therapy research.

Growth is driven by the shift in life science research from bulk-average profiling to cell-level heterogeneity analysis. Tumor microenvironment studies, immune-cell profiling, cell therapy, lineage tracing, rare-cell detection and drug mechanism research all require gene expression, mutation, protein and immune phenotype data at single-cell resolution. As sequencing costs decline, sample throughput improves and bioinformatics tools mature, single-cell technology is expanding from top research institutes to hospitals, pharmaceutical companies and core labs, making consumables and software analysis key revenue drivers.
