Abstracts

The global Single Channel Deep Brain Stimulation (DBS) Devices market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Deep brain stimulation (DBS) is a neurosurgical procedure involving the implantation of a medical device called a neurostimulator (sometimes referred to as a 'brain pacemaker'), which sends electrical impulses, through implanted electrodes, to specific targets in the brain (brain nuclei) for the treatment of movement and neuropsychiatric disorders. DBS in select brain regions has provided therapeutic benefits for otherwise-treatment-resistant disorders such as Parkinson's disease, essential tremor, dystonia, chronic pain, major depression and obsessive-compulsive disorder (OCD). Despite the long history of DBS, its underlying principles and mechanisms are still not clear. DBS directly changes brain activity in a controlled manner, its effects are reversible (unlike those of lesioning techniques), and it is one of only a few neurosurgical methods that allow blinded studies.

A single-channel deep brain stimulation device offers a sophisticated solution for managing neurological disorders by delivering precise electrical stimulation to specific brain regions. The system's effectiveness depends on meticulous planning, accurate implantation, and continuous monitoring and adjustment to tailor the therapy to each patient's unique needs. Regular follow-ups and maintenance are essential to ensure the device's long-term efficacy and safety.
