Simply speaking, a hearing aid is a small device that amplifies the sound reasonably. A hearing aid is basically composed of three parts: a receiver, a microphone, and a chip. The performance of hearing aids mainly depends on the chip, which is the core technology of hearing aids. The chip represents the speed at which the hearing aid can process sound. The better the chip, the faster the processing and the better the hearing. The chip of the hearing aid carries the seven core technologies of hearing aids currently

on the market: noise reduction, compression, open ear fitting, wireless technology, spectrum recombination, directional technology, and feedback suppression technology. These technologies will be presented on a small chip. Therefore, the chip of the hearing aid is a high-tech product with very high research and development costs. There are strong technical and independent property rights.
