A Single Core Power Cable is an electrical cable consisting of a single conductor, typically made of copper or aluminum, insulated with a durable material such as PVC, XLPE (cross-linked polyethylene), or EPR (ethylene propylene rubber). It is designed to carry electrical power in various voltage ranges, including low, medium, and high voltage systems. The single conductor structure makes it ideal for applications requiring high current capacity, especially where electromagnetic interference (EMI) and ease of installation are important considerations. These cables are often used in power distribution networks, industrial plants, renewable energy systems (such as solar and wind farms), substations, underground installations, and heavy-duty electrical equipment. Depending on the installation environment and mechanical protection needs, single core power cables may come with additional features such as metallic armoring, moisture barriers, or flame-retardant jackets.

United States market for Single Core Power Cable is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Single Core Power Cable is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
