The single crystal furnace is a kind of equipment that melts polycrystalline materials such as polycrystalline silicon with a graphite heater in an inert gas environment, and grows a dislocation-free single crystal by the Czochralski method. The single crystal furnace is composed of furnace body, thermal field, magnetic field, control device and other components. After the silicon material is refined and purified into high-purity

polycrystalline silicon, it is necessary to obtain single crystal silicon rods in the single crystal furnace. The thermal field controlling the temperature in the furnace And the magnetic field that controls the crystal growth shape is the key to determine the production capacity of the single crystal furnace.
