Single-element atomic absorption spectrophotometer (Atomic Absorption Spectrophotometer, AAS) is a precision analytical instrument specifically used to analyze the concentration of a single element in a sample. Single-element atomic absorption spectrophotometers work based on the absorption of light of a specific wavelength by atoms. When light from a light source passes through a sample containing the element to be measured, the ground-state atoms in the sample absorb photons corresponding to their specific energy level transitions, thereby transitioning to a high-energy state. During this process, the intensity of the light will weaken, and the degree of weakening is proportional to the concentration of the element in the sample. The instrument can determine the concentration of a specific element in the sample by measuring the change in light intensity after absorption and using spectral analysis technology.

The global Single Element Atomic Absorption Spectrophotometer market size is projected to grow from US\$ 254 million in 2024 to US\$ 308 million in 2030; it is expected to grow at a CAGR of 3.2% from 2024 to 2030.
