A Single Element Ultrasonic Probe is a type of transducer that is used in ultrasonic testing to identify subsurface defects and measure the thickness of materials. It consists of a single piezoelectric crystal that generates ultrasonic waves when subjected to an electrical voltage. These waves travel through the material being tested and are detected by the same crystal when reflected back. The time it takes for the wave to travel and return can be used to calculate material thickness and locate hidden flaws such as cracks, voids or inclusions.

The global Single Element Ultrasonic Probe market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
