The global Single-Ended Current Mode PWM Controller market size is predicted to grow from US$ 1124 million in 2025 to US$ 1587 million in 2031; it is expected to grow at a CAGR of 5.9% from 2025 to 2031.

A single-ended current mode PWM controller is a controller for power converters (such as DC-DC converters) that uses a current mode control strategy to improve system stability and response speed. The controller adjusts the duty cycle of the pulse width modulation (PWM) by monitoring the output current (usually through a sampling resistor), thereby controlling the switching behavior of the switching element (such as MOSFET) to ensure the stability of the output voltage or current. Compared with traditional voltage mode controllers, single-ended current mode PWM controllers can provide faster dynamic response and reduce voltage fluctuations, especially when the load changes rapidly. Its 'single-ended' feature means that the control signal is usually implemented through a single feedback path, rather than dual-ended (such as differential input).

United States market for Single-Ended Current Mode PWM Controller is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Single-Ended Current Mode PWM Controller is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
