The global Single-Ended Input ADC market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A single-ended input analog-to-digital converter is a common type of analog-to-digital converter used to convert a single-ended analog signal to a digital signal. It performs analog-to-digital conversion by comparing a single analog input signal with a reference voltage and converting the comparison result to a digital signal. A single-ended-input ADC typically consists of a comparator, a sample-and-hold circuit, a digital-to-analog converter (DAC), and a successive-approximation register (SAR). Among them, the comparator is used to compare the input signal with the reference voltage, the sample and hold circuit is used to sample and hold the input signal, the DAC is used to convert the gradually approaching digital signal into an analog signal, and the SAR is used to gradually approximate the analog input signal. The actual value, and finally the digital code is output as a representation of the digital signal.

United States market for Single-Ended Input ADC is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
