The global Single Family Unit (SFU) market size is predicted to grow from US\$ 1081 million in 2025 to US\$ 1578 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

Single Family User Unit (SFU) is an optical network terminal used in fiber optic access networks for single households, single households, or small independent access points. It is usually deployed in FTTH fiber to the home scenarios and is used to convert PON optical signals issued by the operator's OLT into user side Ethernet data signals. The product form is mainly single port or multi port Ethernet terminals, with simpler functions than home gateways and usually does not integrate complex routing WiFi? Voice and smart home management capabilities, with a focus on meeting low-cost, stable access, and remote management needs. In 2025, the global sales of SFU units for single household users will be approximately 62.8 million units, with an average unit price of approximately \$17.6 per unit, a capacity utilization rate of approximately 74.8%, and an industry average gross profit margin of approximately 19.2%. Upstream enterprises mainly include PON control chips, optical transceiver devices, optical components PCB? Suppliers of power adapters, connectors, plastic casings, electronic components, firmware software, and testing equipment. The midstream includes ONU and ONT manufacturers, communication terminal ODM foundries, and branded equipment providers. The downstream includes telecommunications operators, regional broadband operators, broadcasting and television network companies, residential broadband service providers, weak current engineering companies, government enterprise network integrators, and channel installation service providers. In the product cost structure, PON chips and main control chips account for about 30.8%, optical transceiver components account for about 20.6%, PCBs and electronic components account for about 13.4%, power and interface devices account for about 7.5%, structural

components and casings account for about 8.2%, manufacturing labor, testing and calibration account for about 9.1%, packaging logistics account for about 4.3%, and software, certification and after-sales quality assurance account for about 6.1%. The downstream demand list includes household fiber optic broadband access, replacement of old copper cable broadband, rural broadband coverage, low ARPU user access, apartment and dormitory broadband coverage, centralized bidding and replacement by operators, park basic network access, broadcasting and television network optical transformation, and regional ISP expansion. The downstream customer list includes China Mobile, China Telecom, China Unicom, Jio, Bharti Airtel, VNPT, AIS, Telkom Indonesia, PLDT, Claro, Telmex, Türk Telekom, Telecom Egypt, Orange, Vodafone, and small and medium-sized broadband operators in various regions. In terms of demand and business opportunities, policy drivers come from broadband popularization, gigabit cities, digital rural areas, public network coverage, and communication infrastructure upgrade projects. Technological innovation drivers come from low-power PON chips, miniaturized optical modules, automated opening, remote diagnosis, cloud operation, and multi generation PON compatibility solutions. Consumer demands are reflected in the increasing dependence on stable fiber optic access for home high-definition video, remote work, online education, smart homes, and low latency network experiences. However, SFU also faces pressure to replace HGU home gateways and XG PON, XGS PON terminals. Therefore, the main business opportunities are concentrated in emerging market FTTH popularization, mature market low-cost replacement, operator equipment procurement, low-power green terminal upgrades, and high reliability basic access scenarios.
