Single gene genetic disease screening service is a medical service that identifies individuals who carry genetic mutations associated with specific genetic diseases

caused by a single gene. The screening process typically involves a blood test or saliva sample analysis to determine whether a person has a genetic mutation that can cause a particular single-gene disorder, such as cystic fibrosis, sickle cell anemia, or Huntington's disease.

The purpose of this screening service is to identify individuals who may be carriers of these genetic mutations and who could pass them on to their children. It allows couples to make informed decisions about their reproductive options, such as undergoing pre-implantation genetic diagnosis (PGD), prenatal testing, or considering adoption. This screening service can also be used for individuals who have a family history of a specific genetic disease to determine whether they are at risk of developing the disease themselves or passing it on to their children.
