Single-head die bonding machine is a kind of equipment used in the semiconductor packaging process, mainly used for fixing and welding the connecting wire (gold wire or copper wire) between the chip (or wafer) and the packaging substrate. It is one of the key equipment in the packaging process. The working principle of the single-head die bonder is to weld the metal wire (usually gold wire or copper wire) between the chip and the package substrate through thermocompression welding technology. Firstly, position the chip and packaging substrate on the workbench of the machine, and then carry out precise alignment and welding between the metal wire and the chip chip pin and the packaging substrate pad through the thermal head. During the soldering process, the

thermal head will apply appropriate temperature and pressure to form a reliable solder connection between the metal wire and the chip and package substrate. The single-head die bonder has the characteristics of high precision, high stability and high efficiency. It can achieve micron-level alignment accuracy and reliable welding quality, and can meet the requirements of semiconductor packaging technology for welding quality and production efficiency. Single-head die bonders are usually used in small batch production and R&D stages. Its operation is relatively simple and it is suitable for chips and substrates of various package types and sizes.
