Single-hinged expansion joint is a special type of expansion joint that is mainly used to compensate for pipeline displacement due to thermal expansion or contraction. Compared with traditional expansion joints, single-hinge type expansion joints use hinge structure to achieve multi-directional free displacement of the pipeline, which has better shock resistance, torque resistance and greater adaptability. The single-type hinge expansion joint consists of a corrugated pipe and a structural component such as a pin, hinge plate and wall plate. It can only absorb angular displacement in a plane and can withstand the pressure and thrust of the bellows. Connection form: welding connection, flange connection. In 2024, global Single Hinge Expansion Joint production reached approximately 591 k units, with an average global market price of around US$ 635 per unit.
