The global Single Lacrimal Canaliculus Stent market size is predicted to grow from US\$ 18.18 million in 2025 to US\$ 33.77 million in 2032; it is expected to grow at a CAGR of 9.1% from 2026 to 2032.

A single lacrimal canaliculus stent is a minimally invasive medical device specifically designed to maintain the patency of a single lacrimal canaliculus. Typically made of flexible silicone or biocompatible materials, it is inserted into the lacrimal canaliculus and fixed within the lacrimal duct to prevent postoperative stenosis or occlusion. This stent design simplifies the insertion procedure, reduces damage to the lacrimal sac and surrounding tissues, and supports lacrimal duct self-healing and long-term functional recovery while maintaining normal tear drainage.

From a clinical and medical device perspective, the single lacrimal canaliculus stent is widely considered the preferred minimally invasive option for treating unilateral lacrimal canaliculus stenosis or obstruction due to its ease of use, minimal invasiveness, and good patient tolerance. Compared to traditional double lacrimal canaliculus or lacrimal sac stents, the single lacrimal canaliculus stent reduces surgical complexity and complication risks while maintaining normal tear drainage, thus improving surgical success rates and postoperative quality of life. Therefore, it has significant clinical application value in ophthalmic lacrimal duct reconstruction surgery.

In 2025, the average price of a single lacrimal canaliculus stent is \$17 per unit, with sales of 1.093 million units, a total production capacity of 1.56 million units, and a gross profit margin of approximately 48%.
