Single-layer blister film refers to a film for blister packaging consisting of a single material layer. This film is usually used for the packaging of products such as medicines, food, and cosmetics. The product is filled in the blister by vacuum blistering or compression molding, and sealed by heat sealing or other methods using a covering material (which may be another layer of film or cardboard, etc.). Since the single-layer blister film has high transparency, it can clearly show the appearance and color of the product. This helps to attract consumers' attention and increase product sales.

The material selection of single-layer blister film usually depends on the characteristics of the product and packaging requirements. Common materials include aluminum foil, polyester (PET), polyethylene (PE), etc. These materials have good barrier properties, transparency and flexibility, and can meet the packaging needs of different products.
