Abstracts

The global Single Layer Perceptron market size is predicted to grow from US\$ 1228 million in 2025 to US\$ 2154 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

A Single Layer Perceptron (SLP) is the simplest form of an artificial neural network, consisting of a single layer of trainable weights that connects input features directly to an output neuron, which computes a weighted sum of the inputs followed by an activation function, typically a step or sign function, to produce a binary classification; it learns by iteratively adjusting its weights based on classification errors, enabling it to separate linearly separable data with a hyperplane, but it lacks the capacity to model nonlinear relationships, making it unsuitable for problems such as XOR that require complex decision boundaries.
