Single Low-E (Low-Emissivity) Glass refers to a type of glass that has a special coating applied to its surface to reduce the amount of infrared and ultraviolet (UV) radiation that can pass through it. The term 'Low-E' refers to the glass's low emissivity, which means it has a low ability to emit radiant heat.

Low-E glass has a wide range of application requirements in the construction and automotive industries. In the field of construction, Low-E glass is used on building facades such as windows, curtain walls and sun rooms to reduce heat conduction and heat radiation and improve the energy efficiency of buildings. In the automotive industry, Low-E glass is used in windows and sunroofs to block the entry of solar radiation and heat and provide a comfortable interior environment. The market demand for Low-E glass is mainly driven by energy saving, environmental protection and comfort requirements.
