The global Single-Photon Time Measurement Module market size is predicted to grow from US\$ 70.92 million in 2025 to US\$ 135 million in 2032; it is expected to grow at a CAGR of 9.4% from 2026 to 2032.

In 2025, global sales of Single-Photon Time Measurement Module reached approximately 2,060 units, with an average market price of about USD 35,194 unit, an annual production capacity of roughly 2,400 units, and an industry-average gross margin of approximately 29%.

Single-Photon Time Measurement Modules are high-precision electronic measurement instruments designed to capture, digitize, timestamp, histogram and analyze the arrival time of individual photon events. They are typically supplied as benchtop units, USB or Ethernet modules, PCIe/PXIe cards, NIM or rack-mounted electronics, embedded acquisition boards, or timing units integrated into spectroscopy and quantum measurement platforms. These modules receive electrical pulses from single-photon detectors such as SPADs, PMTs, MCP-PMTs, SNSPDs and SiPMs, and process the signals through time-correlated single-photon counting, time tagging, time-to-digital conversion, time-tagged time-resolved acquisition, histogramming, coincidence counting, correlation analysis and multi-channel scaling. Key specifications include timing resolution, timing jitter, dead time, maximum count rate, number of input channels, synchronization capability, input signal compatibility, data throughput, hardware interface and software/API support. They are mainly used in fluorescence lifetime measurement, FLIM, time-resolved spectroscopy, quantum optics, quantum communication, single-photon LiDAR, satellite laser ranging, detector characterization and advanced photonic testing.
