The global Single Plane Illumination Microscopy (SPIM) market size is predicted to grow from US$ 73.4 million in 2025 to US$ 107 million in 2031; it is expected to grow at a CAGR of 6.5% from 2025 to 2031.

Single Plane Illumination Microscopy (SPIM) is an optical microscopy technique that uses a single plane of light to illuminate the sample for efficient 3D imaging. SPIM focuses a laser or other light source into a thin plane of light, illuminating specific sections of the sample perpendicular to the observation axis. Unlike traditional confocal microscopy, SPIM scans and captures high-contrast images without illuminating the entire sample, minimizing light-induced damage and thermal effects. The selective illumination of only the observed section allows SPIM to provide high optical resolution and contrast, making it ideal for live-cell imaging, developmental biology research, and other applications where fast and low photodamage imaging is required.

United States market for Single Plane Illumination Microscopy (SPIM) is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Single Plane Illumination Microscopy (SPIM) is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Single Plane Illumination Microscopy (SPIM) is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
